ROS Distro index file associate with commit '43659b6409dcb545fd3d25c6d977f195cdf886a'
New ROS Distro index url: 'https://raw.githubusercontent.com/ros/rosdistro/43659b6409dcb545fd3d25c6d977f195cdf886a/index.yaml'
Specified repository 'mastering_ros_demo_pkg' is not in the distribution file located at 'https://raw.githubusercontent.com/ros/rosdistro/43659b6409dcb545fd3d25c6d977f195cdf886a/kinetic/distribution.yaml'
Could not determine release repository url for repository 'mastering_ros_demo_pkg' of distro 'kinetic'
You can continue the release process by manually specifying the location of the RELEASE repository.
To be clear this is the url of the RELEASE repository not the upstream repository.
For release repositories on GitHub, you should provide the `https://` url which should end in `.git`.
Here is the url for a typical release repository on GitHub: https://github.com/ros-gbp/rviz-release.git
==> Looking for a release of this repository in a different distribution...
A previous distribution, 'indigo', released this repository.
Release repository url [https://github.com/qboticslabs/demo_pkg-release.git]: https://github.com/jocacace/demo_pkg-release.git
```

```
Given track 'kinetic' does not exist in release repository.
Available tracks: []
Create a new track called 'kinetic' now [Y/n]? Y
Creating track 'kinetic'...
Repository Name:
  upstream
  Default value, leave this as upstream if you are unsure
  <name>
  Name of the repository (used in the archive name)
  ['upstream']: mastering_ros_demo_pkg
Upstream Repository URI:
  <uri>
  Any valid URI. This variable can be templated, for example an svn url can be templated as such: "https://svn.foo.com/foo/tags/foo-:{version}" where the :{version} token will be replaced with the version for this release.
  [None]: https://github.com/jocacace/mastering_ros_demo_pkg.git

- Virtual Joints
- Planning Groups
- Robot Poses
- End Effectors
- Passive Joints
- Author Information
- Configuration Files

MoveIt Setup Assistant

Welcome to the MoveIt Setup Assistant! These tools will assist you in creating a MoveIt configuration package that is required to run MoveIt. This includes generating a Semantic Robot Description Format (SRDF) file, kinematics configuration file and OMPL planning configuration file. It also involves creating launch files for move groups, OMPL planner, planning contexts and the planning warehouse.

Choose mode:

All settings for MoveIt are stored in a MoveIt configuration package. Here you have the option to create a new configuration package, or load an existing one. Note: any changes to a MoveIt configuration package outside this setup assistant will likely be overwritten by this tool.

Optimize Self-Collision Checking

The Default Self-Collision Matrix Generator will search for pairs of links on the robot that can safely be disabled from collision checking, decreasing motion planning processing time. These pairs of links are disabled when they are always in collision, never in collision, in collision in the robot's default position or when the links are adjacent to each other on the kinematic chain. Sampling density specifies how many random robot positions to check for self collision. Higher densities require more computation time.

Sampling Density: Low High 10000

Min. collisions for "always"-colliding p:

Generate Configuration Files

Create or update the configuration files package needed to run your robot with MoveIt. Uncheck files to disable them from being generated - this is useful if you have made custom changes to them. Files in orange have been automatically detected as changed.

Configuration Package Save Path
Specify the desired directory for the MoveIt configuration package to be generated. Overwriting an existing configuration package directory is acceptable. Example: `/u/robot/ros/pr2_moveit_config`

Files to be generated: (checked)

- package.xml
- CMakeLists.txt

The screenshot shows a ROS navigation interface. At the top, there is a toolbar with buttons for 'Interact', 'Move Camera', 'Select', 'Focus Camera', 'Measure', '2D Pose Estimate', '2D Nav Goal' (highlighted in red), and 'Publish Point'. Below the toolbar is a 'Displays' panel on the left, which contains a tree view of displays and their settings. The tree view includes 'Global Options', 'Global Status: Ok', 'Grid', 'LaserScan', 'RobotModel', 'Map', 'Global_plan', 'Local_plan', 'Goal', 'Path', 'Global_Costmap', and 'Local_Costmap'. The 'Local_Costmap' display is expanded, showing settings for 'Status: Ok', 'Topic: /move_base/local_cost...', 'Alpha: 0.7', 'Color Scheme: costmap', 'Draw Behind: unchecked', 'Resolution: 0.05', 'Width: 80', and 'Height: 80'. Below the 'Displays' panel is a 'Color Scheme' section with 'Add', 'Remove', and 'Rename' buttons. The main area of the interface is a 2D map showing a robot (a small white circle) moving along a path (a black line) towards a goal (a red circle). The map also shows a costmap (a cyan and yellow area) and a laser scan (a red and yellow area). At the bottom of the interface is a 'Time' panel with fields for 'ROS Time: 330.01', 'ROS Elapsed: 291.86', 'Wall Time: 1445970678.92', and 'Wall Elapsed: 465.51'. There is also an 'Experimental' checkbox.

Time

ROS Time: 1440179773.67 ROS Elapsed: 77.18 Wall Time: 1440179773.77 Wall Elapsed: 77.22 Experimental

Reset Left-Click: Rotate. Middle-Click: Move X/Y. Right-Click/Mouse Wheel: Zoom. Shift: More options. 8 fps

The screenshot shows the ROS GUI interface. On the left, the 'Displays' panel is open, showing configuration for a PointCloud2 display. The 'Topic' is set to '/camera/depth/points', the 'Style' is 'Points', and the 'Color Transformer' is 'AxisColor'. The 'Position Transformer' is set to 'XYZ'. The 'Add' button is highlighted with a red box. On the right, a 3D visualization shows a point cloud of a rectangular object, colored with a gradient from blue to red. The object is positioned on a grid floor. The bottom of the screen shows the 'Time' panel with ROS and wall time, and a status bar with '8 fps'.

Block Parameters: Blank Message

ROS Blank Message (mask) (link)

Create a blank message with the specified message type.

The "Msg" block output is a blank ROS message (bus signal). Use a Bus Assignment block to modify specific fields in the bus signal.

The bus signal is initialized to zero value (ground).

Parameters

Message type:

Sample time: ⓘ *Not recommended for this block. Set to -1 to remove. [Why?](#)*

Select ROS Message Type

- geometry_msgs/PoseWithCovariance
- geometry_msgs/PoseWithCovarianceStamped
- geometry_msgs/Quaternion
- geometry_msgs/QuaternionStamped
- geometry_msgs/Transform
- geometry_msgs/TransformStamped
- geometry_msgs/Twist

ROS Publish (mask) (link)

Send messages to a ROS network.

The "Msg" block input accepts a ROS message (bus signal).

To select from a list of available topics, set "Topic source" parameter to "Select from ROS network" and use the "Select..." button. The message type for the selected topic is set automatically.

To enter a custom topic, set "Topic source" to "Specify your own". Use the "Topic" parameter to specify the name, and the "Select..." button to select the message type.

Chapter 15: Troubleshooting and Best Practices in ROS

The image shows a screenshot of an IDE with three main areas highlighted by red boxes and numbered 1, 2, 3, and 4.

- 1:** The Explorer view on the left shows the file structure of the ROS workspace. The `src` directory is expanded, showing various source files like `demo_action_client.cpp`, `demo_action_server.cpp`, `demo_msg_publisher.cpp`, `demo_msg_subscriber.cpp`, `demo_service_client.cpp`, `demo_service_server.cpp`, `demo_topic_publisher.cpp`, and `demo_topic_subscriber.cpp`.
- 2:** The Node view at the bottom left shows the running nodes in the workspace, including `demo_action_client`, `demo_action_server`, `demo_msg_publisher`, `demo_msg_subscriber`, `demo_service_client`, `demo_service_server`, `demo_topic_publisher`, and `demo_topic_subscriber`.
- 3:** The main editor window displays the source code for `demo_action_client.cpp`. The code includes a license notice, a comment indicating it subscribes to integer values from `demo_topic_publisher`, and the main function which initializes ROS and calls `ros::init`.
- 4:** The Terminal view at the bottom right shows the output of the running nodes. It displays several INFO messages with timestamps and IDs, such as `[1515336775.977908157]: 26`, `[1515336775.977996830]: hello world`, and `[1515336775.978560442]: Recieved greeting [hello world]`.

- Remote Deploy

The screenshot shows the Visual Studio Code interface. At the top, the Explorer view is active, showing a workspace named 'ROS_WS_V2'. The file tree is expanded to show the 'src' directory, which contains subdirectories 'mastering_ros_demo_pkg' and 'roboware_package', a file 'CMakeLists.txt', and a file '.catkin_workspace'. A dropdown menu is open over the Explorer view, showing the 'Release' configuration selected. The menu options are: Release, Debug, Release, Debug (isolated), Release (isolated), Debug (remote), Release (remote), Debug (remote isolated), Release (remote isolated), and Remote Deploy. The 'Release' option is highlighted in blue. The interface also shows the 'OPEN EDITORS' section and various icons for file operations and settings.

The file will not be displayed in the editor because it is either binary, very large or uses an unsupported text encoding.

ROS PACKAGES MANAGER

metapackages

ackermann_msgs
ROS messages for robots using Ackermann steering.
1.0.1-0 maintained INSTALL

actionlib
For interfacing with preemptible tasks. This includes performing a laser scan and returning one or more point clouds, detecting the handle of a door, etc.
1.11.7-0 maintained UNINSTALL

agvs_common
URDF description of the Agvs and Agvs.
0.1.3-1 maintained INSTALL

agvs_sim
agvs Gazebo simulation packages
0.1.3-0 maintained INSTALL

angles
This package provides a set of simple math utilities to work with angles. The utilities cover simple things like normalizing an angle and conversion between degrees and radians. But even if you're trying to calculate things like the shortest angular distance between two joint space positions of your robot, but the joint motion is constrained by joint limits, this package is what you need. The code in this package is stable and well tested. There are no plans for major changes in the near future.
1.9.10-0 maintained UNINSTALL

ar_track_alvar
This package is a ROS wrapper for Alvar, an open source AR tag tracking library.

Package Summary

✔ Released
✔ Continuous Integration
✔ Documented

The actionlib stack provides a standardized interface for interfacing with preemptible tasks. Examples of this include moving the base to a target location, performing a laser scan and returning the resulting point cloud, detecting the handle of a door, etc.
